ANGLAIS PROFESSIONNEL DE SANTÉ

PROFESSIONAL ENGLISH FOR HEALTHCARE

(BSc1 N&MID)

/

ANGLAIS PROFESSIONNEL DE SOINS DE SANTE

(L1 SIO)

EDITION: 2026

DETAILED OUTLINE OF THE COURSE

LEVEL: BSc I Nursing and Midwifery Learners
 ACADEMIC YEAR: 2025-2026
 COURSE TITLE: Professional English for Healthcare
 Identification of the course : UE : Outils de communication ECUE : Anglais Pro santé
 Code : IRCH1107
 Crédit : 1
 Lecture location : Amphitheatre
 Instructor: Pedagogical Unit Member
 Phone Number: Email:
 Availability: anytime

I. COURSE DESCRIPTION

1. Main objective
Develop Medical/Nursing English skills in health learners in the field of Health
2. Specific objectives
-Listen to the pronunciations in new vocabulary points
-Identify some words in relation to Health
-Exchange in a little dialogue with acquired knowledge by two at least.
-Write and read exactly technical words

II. OUTLINE AND CONTENTS

III. EDUCATIONAL METHOD

1. TEACHING ACTIVITIES

The course will be delivered through lectures and will be supported with a fascicle to Nursing and Midwifery students of BSc I

2. LEARNING ACTIVITIES

During tutorials, some exercises will be proposed in terms of research and

conversations. Blending E-learning is also used to strengthen this specific training.

3. ASSESSMENTS

A mark will be given to each student during the different presentations in a dialogue by two a few days or a day after the lecture. During the first semester, a final examination will be held in class.

IV ABILITIES

At the end of this course, students shall be able to undertake a conversation using basic knowledge in relation to words of health

LA PLACE DE L'ANGLAIS CHEZ L'AGENT DE SANTE

Pourquoi l'Anglais aux agents de santé ?

Personne n'ignore aujourd'hui l'utilité de l'Anglais dans tous les domaines de la vie publique. Le monde s'ouvre et il faut s'ouvrir au monde par la connaissance et la pratique de la langue la plus utilisée en communication dans le monde.

Les agents de santé ne doivent pas rester en marge de cette évolution car ils ont besoin de l'Anglais, depuis leur centre de santé rural jusqu'au service de l'Institut le plus spécialisé, pour communiquer.

Les Organisations internationales, les ONG internationales, nous parlerons toujours de la connaissance de l'Anglais pour intégrer leurs structures de santé.

Partant de tout ceci, il est bon pour nous, agents de santé de l'apprendre ou du mieux, la parfaire. La santé est un domaine réservé dont les contours sont difficilement cernables par le

commun des mortels. Nous estimons pour notre part, que ne peut mieux rendre les connaissances d'un domaine aussi spécifique que la santé que celui qui s'y met à fond.

C'est fort de cela que nous avons bien voulu partager nos connaissances acquises pour certains dans les départements d'Anglais des Universités et pour d'autres dans les pays parlant Anglais ; non seulement aux étudiants en sciences de la santé mais aussi aux confrères et collaborateurs de santé.

Avant tout, l'on doit savoir que l'Anglais est une langue vivante et en tant que telle, elle doit se pratiquer en la parlant, en l'écoutant pour préparer la langue et les oreilles ; Telle est notre mission en préparant ce module de formation.

LA CELLULE ANGLAIS DE SANTE DE L'INFAS

CHAPITRE I : QUELQUES MOTS DE SANTE, MEDECINE

	Sain (plein de santé)
WHOLESOME	Sain (bon pour la santé)
PAINFUL	Douloureux
SICKLY	Maladif
SERIOUSLY ILL	Gravement malade
TUBERCULOSIS, CONSUMPTION	Tuberculose
ANGINA, QUINSY	Angine
MUMPS	Oreillon
STIFF NECK	Torticolis
MEASLES	Rougeole
SMALLPOX	Variole
To take to one's bed	S'Aliter
BRONCHITIS	Bronchite
SCAR	Cicatrice
DIZZINESS	Vertige

SWELLING	Enflure
RECOVERY (from an illness)	Guérison (d'une maladie)
TO VACCINATE	Vacciner
A VACCINE	Un vaccin
TO RELIEVE	Soulager
HEALING (of a wound)	Guérison (d'une plaie)
DRESSING, BANDAGE	Pansement
NETTLE-RASH, URTICARIA	Urticaire
BLISTER	Ampoule
DIET	Régime
BOIL	Furoncle
PIMPLE	Bouton
BRUISE	Contusion

CHAPTER II: NURSING

2.1 THE HISTORY OF NURSING

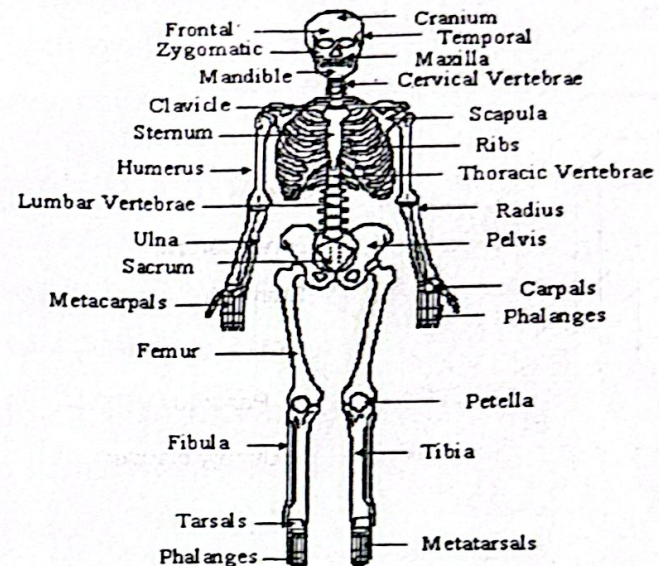

2.3 SUBCONCEPTS (Virginia Henderson)

14 Activities for Client Assistance

1. Breathe normally
2. Eat and drink adequately
3. Eliminate body wastes
4. Move and maintain desirable postures
5. Sleep and rest
6. Select suitable clothes – dress and undress
7. Maintain body temperature within normal range by adjusting clothing and modifying environment
7. Maintain body temperature within normal range by adjusting clothing and modifying environment
8. Keep the body clean and well-groomed and protect the integument
9. Avoid dangers in the environment and avoid injuring others
10. Communicate with others in expressing emotions, needs, fears, or opinions.
11. Worship according to one's faith
12. Work in such a way that there is sense of accomplishment
13. Play or participate in various forms of recreation
14. Learn, discover, or satisfy the curiosity that leads to normal development and health and use the available health facilities.

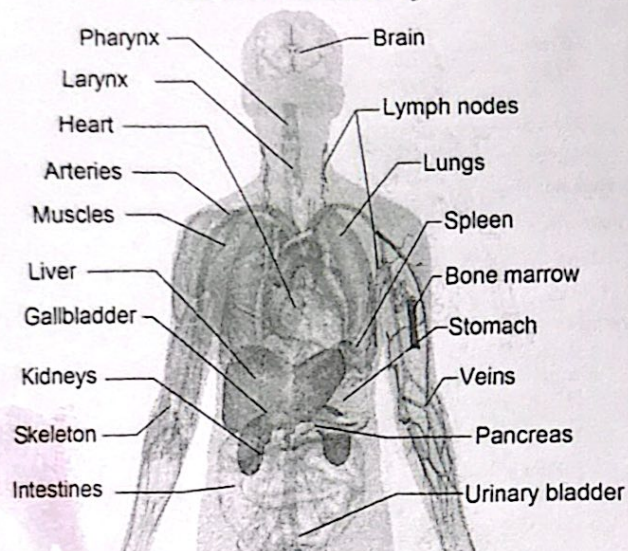

CHAPTER III: ANATOMY

3.1 HUMAN BODY SKELETON

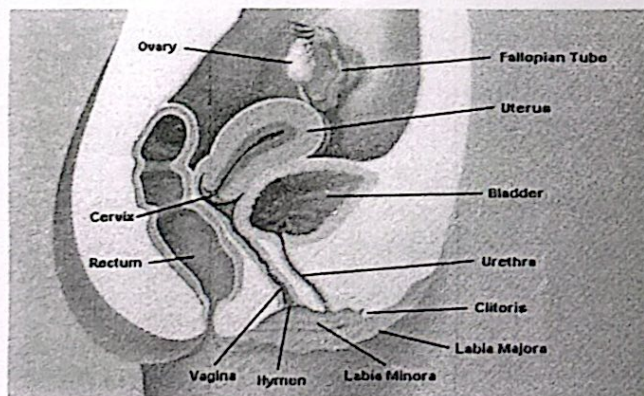

3.2 HUMAN ORGANS

Human anatomy

CHAPTER IX: FEMALE REPRODUCTIVE SYSTEM

CHAPTER IV: DESINFECTION AND STERILISATION OF MEDICAL EQUIPEMENT DESINFECTION

4.1 MEDICAL EQUIPMENT/SUPPLIES

4.1.1 VARIOUS SCAPELS

A scalpel, or lancet, is a small and extremely sharp bladed instrument used for surgery, anatomical dissection, and various arts.

4.2 MEDICAL AND MINOR SURGICAL PROCEDURES

4.2.1 Dressings

4.2.1.1 Bandage Scissors

4.2.1.2 Needle holder

CHAPTER V: HEALTHCARE PROVIDERS

Define in your own terms these words:

Nurse

Midwife

Physician

Medical Practitioner

Medical doctor

Hygiene technician

Medical imaging technician

Radiologist

Community health worker

Physiotherapist (PT)

Dentist

Surgeon

Gynecologist

Pediatrician

Biologist technician

Hospital ward girls and boys

Healthcare assistant

CHAPTER VI: COMMON TASKS IN HOSPITALS OR DISPENSARIES

5.1 PREVALENT DISEASES IN A CONSULTATION

5.1.1. PAIN

Pain is an uncomfortable sensation.

It is a subjective sensation which is expressed differently by each patient depending on their cultural background, age etc.

We have acute or chronic pain.

Onset : at rest, at night, on movement, sudden...

Location : Head, thorax, abdomen, lumbar region

Type : Burning, cramping, radiating, spasmodic, hurting

5.1.2 FEVER

Fever is defined as a temperature higher than 37.5°C axillary and 38°C if measured rectally.

We can use an electronic thermometer. Temperature should be measured over a period of 5 minutes when using a mercury thermometer

Complications :

Convulsion

Dehydration

Confusion

Delerium

5.1.3 FATIGUE

Fatigue is one of the common reasons for medical consultation. It is subjective.

The context of onset: It can be progressive or abrupt, long-standing or recent.

The nature of fatigue: physical, intellectual, sexual (usually of psychological origin)

CHAPTER VII: CONTEXT OF THE EXAMINATION

6.1 HISTORY TAKING

6.2 CLINICAL EXAMINATION

6.3 THE EXAMINATION

6.4 BASIC EXAMINATION

CHAPTER VIII: RESPIRATORY DISEASES

7.1 RHINITIS AND RHINOPHARYNGITIS

7.2 ACUTE SINUSITIS

7.3 PERTUSSIS

CHAPTER IX: GASTROINTESTINAL DISORDERS

8.1 ACUTE DIARRHOEA

Symptoms

Diarrhea causes similar symptoms for adults and children, such as

- loose, watery stools three or more times a day, or more often than what is normal for you
- an urgent need to use the bathroom
- cramping or pain in the abdomen
- loss of control of bowel movements
- nausea
- weight loss, if you have chronic diarrhea

CHAPTER X: PARASITIC DISEASES

9.1 MALARIA

Malaria is a parasitic disease due to plasmodium transmitted to man by the female anopheles mosquito.

As clinical signs, we have fever, chills, sweating, headache, muscular ache, anorexia nausea. In children, gastrointestinal disorders are frequent with abdominal pain, diarrhea and vomiting.

Prevention

- Individual protection against anopheles mosquitoes
 - o Impregnated mosquito net
 - o Long sleeves and trousers in the evening
 - o Application of insect repellents
 - o Slow-burning mosquito coils
- Chemoprophylaxis
 - o Mass chemoprophylaxis is not recommended and collective prevention should only address the eradication of anopheles
 - o Mosquitoes

Text 1: MALARIA AND PREGNANCY

- Malaria is the most widely spread parasitic disease in Africa. It is particularly serious with the child and the pregnant woman whose foetus survival is at risk. However, it is a world disease with about 500 millions people thought to be infested every year, 90 percent of whom live in Africa. As such, the death toll amounts to 1, 5 million people every year due to malaria. And children less than 5 years old pay the highest price.
- It is believed that each year, 23 million pregnant women suffer from malaria, causing many complications such as premature birth, foetal death, maternal death, anaemia, miscarriages, babies of small weight and later, complications for the children, namely, convulsions and epilepsy.
- Taking care of the pregnant woman requires preventive measures and correctly treating serious attacks of illness.
- The WHO recommends action at 3 levels:
 - 1. The use of pesticide impregnated mosquito net;
 - 2. Preventive treatment at regular time intervals: 2 to 3 doses of a combined treatment during pregnancy, a low cost medicine;
 - 3. Efficient treatment of bouts of malaria.

CHAPTER XI: BACTERIAL DISEASE

10.1 TETANUS

10.2 PREVENTION

CHAPTER XII: VIRAL DISEASES

11.1 MEASLES

How is measles transmitted in children? (Exercise)

11.2 POLIOMYELITIS

How is poliomyelitis transmitted in children? (Exercise)

DIALOGUE 1: Conversation between two nurses

Nurse 1: I didn't have a sleep tonight after that hard work I had.

Nurse 2: So, what happened tonight?

Nurse 1: An accident happened on the road to Noé. There were many victims; some, injured and others, dead. I could not imagine. It was really terrible. More than fifteen persons were lying on the floor, bleeding.

Nurse 2: What did you do then?

Nurse 1: What can you imagine? I couldn't do anything alone. It was so serious that I called for help. Nurses, Midwives, physicians, practitioners, surgeons and other health workers came for help. Even, the regional and district directors were on the field.

Nurse 2: You have really worked a lot.

Where are the other forceps that have not been used for the interventions? I can see some stained in the pans.

Nurse 1: Sorry; I am too tired. You can find some in the toolboxes and also compresses in the drums for sterilization in the autoclave.

Nurse 2: OK. Thank you and have a good rest.

Dialogue 2: A physician and a patient

P: Good morning Doctor.

D: Good morning Sir

P: I come for a consultation because I have been coughing for a week and I have a pain in my chest. I don't smoke and I don't drink alcohol.

D: Let's me have a look.

Well, I see. You were on TB treatment 3 months ago. Why did you abandon your treatment? You should not.

P: Doctor, the treatment was very hard and I couldn't stand it for a long time.

D: Now, you have to resume the whole treatment for six months. It is the only way to recover from that illness by taking antituberculosis drugs every day.

DIALOGUE 3: (A pregnant woman and a Midwife during prenatal consultation)

Midwife: Good morning Women. You all come to the prenatal consultation this morning. I'm really proud of you because not only you want to preserve your own life but also the life of your children.

A Woman: Excuse me. This is my first pregnancy and I want to know how can i preserve my baby's life since I already carry him in my belly. Me, I only know one thing; the childbirth will come. I have just come for my health booklet.

Midwife: Woman, I was saying that I'm proud of you because you really desire the baby you carry in your belly. If that baby breathes, it is because you breathe. If it eats, it is because you eat. So if you are ill, it will be also ill. If you don't breathe, it won't breathe.

Woman: I don't want to lose my baby.

Midwife: So, consider you are here to see if your baby feels good and you as mother, you are not sick so that when the baby comes, it feels good, alive and lives in good conditions. That is the reason why you should accept blood tests and urinary ones; this includes hemoglobin, albumin-sugar, hiv...

Woman: What! You say hiv? You mean AIDS? I'm not ready for that. I told you that I have come for my booklet. I can do every test but never hiv test. Why I would do it. Never.

Midwife: Noooh! Hiv does not mean AIDS. You see, protecting the child to be born is a matter of justice and rights. Now, it is systematic to protect the child and also the mother and the medicine exists. Don't fear.

Woman: OK. As you said, I really want to protect my baby. It is my first child! What else can I do for him? It is my own desire.

DIALOGUE 4: (Pregnant woman and the midwife during the prenatal consultation)

Woman: Good morning Madam. I have come to see you for an echography and also have a booklet for the childbirth. This is what a neighbour told me.

But you, you only gave me a lot of tablets to take.

Midwife: The tablets I' m giving to you are medicines against malaria. It is a very dangerous disease for pregnant women. It can also cause complications to your baby or his death.

Woman: You mean that all the women here are concerned with this problem?

Midwife: Yes! Of course. You see, malaria is the most common cause of death among pregnant women and infants according to the WHO. That is the reason why you are given medicines to prevent malaria.

Woman: My neighbor told me that I lack blood. Is she right? What can I do?

Midwife: She may be right, but first, you have to do all your tests to know if you lack blood or not. Most of the time, all pregnant women are confronted with the matter of anemia. But don't fear, no matter how is the result, you are given some tablets against anemia for prevention to protect your child.

To prevent anemia, you need to eat many vegetables such as potatoes, onion etc.

Woman: Thank you. Now, I have understood why it is important to come to prenatal consultation.

DIALOGUE 5:

(During a vaccination campaign against polio, a parent discussing with a health worker)

Parent: Since you have started, you never end with this polio matter. What is polio in reality?

Health worker: Polio means poliomyelitis. It is caused by a virus. We call it Wild Polio virus with types that can be found everywhere in the environment.

Parent: How can we know that a child has polio?

Health worker: A fever can appear in the child and a flaccid paralysis can be noticed. The child cannot move his legs or hands even after an injection or any other illness.

Parent: How is this disease transmitted?

Health worker: It is generally transmitted by stools in the environment staining the ground, vegetables and other comestibles throughout streaming water or floods. Dirty hands, stained water or vegetables are most of the time sources of transmission.

Parent: Why are children only concerned?

Health worker: In some countries, adults have been into contact with the germ; but most of the time, children from 0 to 14 years are concerned.

Parent: can I know a few signs of the disease?

Health worker: After a fever, you notice that the child cannot stand on his feet because his legs are flaccid. It can also be the arms or even the chest by constriction. If it appears to be polio disease, the position is irreversible.

Parent: Hein! It is really serious.

Health worker: It is not funny.

DIALOGUE 6: (A woman comes to a nurse with her kid)

Woman: Good morning Sir. Somebody told me that I could come to you for a consultation because my kid has skin condition.

Nurse: Can you tell me the onset of that disease?

Woman: He has never got a problem of this kind. Two days ago, I noticed that there were pimples all over his body but it does not itch.

Nurse: Does he have any fever? Don't you remember any insect bites?

Woman: Yes he has fever but I don't remember any insect bites. Anyway, you see children play everywhere and one never knows.

Nurse: Let's me have a look in the note book of health on the vaccination schedule.

Your kid is not vaccinated against measles. I'm going to prescribe some medicines to your child but after his recovery, don't forget the vaccination. He will be more protected.

Woman: I have understood your advice. I thank you Sir.

CONVERSATION 7: A patient (Pregnant woman) and a midwife

Patient: I have been bleeding for 3 days.

Midwife: I see you are pregnant. Why didn't you come earlier?

Patient: I'm sorry

Midwife: Would you lay down here so that I examine you.

(After the examination)

Midwife: How many months lasts your pregnancy?

Patient: Only a month.

Midwife: OK, I see. You bleed a lot; I'm going to refer you to the gynecologist down town. I suspect an ectopic pregnancy. I would advise you to be in a hurry because it is really serious.

(At home, the patient to her husband)

Patient: When I was bleeding this morning, I went to the midwife's who sent me in urgency to the gynecologist's. She said that it was serious.

Husband: She may be right. Let's go there quickly.

ENGLISH TEST

FULL NAME :

LEVEL :

I. TRUE OR FALSE (T) OR (F)

1. PCV 13 means Polio Coughing Vaccine
2. HepB means Hepatitis type
3. Measles is not a viral disease
4. In côte d'Ivoire, the target of the EPI is from 0 to 11 month of age
5. In Hib, the letter (I) means Infectious
6. Childbearing women target is for pregnant women
7. The germ of poliomyelitis is called wild polio virus
8. Cholera is defined as the loss of water and salt from the body
9. Tuberculosis is part of the diseases of dirty hands
10. Cholera is not likely to spread directly from one person to another
11. Malaria is a parasitic disease
12. To avoid cholera, cook food well, especially seafood.
13. Ovale is one of the species of Malaria
14. In children, the transmission of Measles is indirect
15. Onchocercosis is a bacterial disease
16. Typhoid fever is part of the diseases of dirty hands
17. Poliomyelitis transmission is oral fecal
18. The agent responsible for yellow fever transmission is amaril virus
19. in the jungle, the aedes mosquito transmits yellow fever T
20. With the sputum sample, we can perform hemoglobin testing F
21. There is the same way of transmission in tetanus and dengue F
22. We have the same way in transmission in cholera and typhoid fever
23. A viral disease and a bacterial disease have the same way of contamination in some cases. We have the case of polio disease and tuberculosis
24. A viral disease and a bacterial disease have the same way of contamination in some cases. We have the of polio disease and typhoid fever

II. Multiple Choice Statements

Choose the right answer(s)

25. The chart that is used for vaccination is called :
 - vaccination coverage
 - vaccination rate
 - vaccination schedule
26. The DTP vaccine is composed of (3 answers):
 - Polio antigen
 - Pertussis antigen
 - Tuberculosis antigen
 - Dengue antigen
 - Diphtheria antigen
 - Tetanus antigen
27. Cholera germs are found in (2 answers) :
 - the blood of infected people
 - the feces of healthy people
 - the sputum of infected people
 - the stools of infected people
 - the feces got into the water people drink
28. To prevent Cholera, you must (2 answers) :
 - wash your hands often with soap and safe water
 - eat your food when it is not hot
 - use latrines or bury your feces
 - avoid sneezing and coughing patients
29. To look at the general conditions, the health worker (2 answers)
 - checks the blood pressure
 - takes a sample of blood
 - checks the temperature
 - performs malaria rapid test
 - hospitalizes the patient
30. two different ways of writing:
 - Health center
 - Health center
 - Health center
 - Health center
 - health centre
